Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at P-10 is 3640.66 feet above mean sea level .

Depth to water measurements collected on September 17 between 6:30 - 7:35 am.

Depth to water in P-10 was 20.73 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at P-12 is 3623.14 feet above mean sea level .

Depth to water measurements collected on September 17 between 6:30 - 7:35 am.

Depth to water in P-12 was 5.90 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at P-15 is 3606.98 feet above mean sea level .

Depth to water measurements collected on September 17 between 6:30 - 7:35 am.

Depth to water in P-15 was 3.76 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at OW-7U is 3624.7 feet above mean sea level .

Depth to water measurements collected on September 17 between 6:30 - 7:35 am.

Depth to water in OW-7U was 12.13 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at RP-1 is 3616.4 feet above mean sea level .

Depth to water measurements collected on September 17 between 6:30 - 7:35 am.

Depth to water in RP-1 was 1.90 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at RP-2 is 3614.32 feet above mean sea level .

Depth to water measurements collected on September 17 between 6:30 - 7:35 am.

Depth to water in RP-2 was 1.60 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at RP-3 is 3617.27 feet above mean sea level .

Depth to water measurements collected on September 17 between 6:30 - 7:35 am.

Depth to water in RP-3 was 4.31 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at RP-4 is 3617.74 feet above mean sea level .

Depth to water measurements collected on September 17 between 6:30 - 7:35 am.

Depth to water in RP-4 was 2.81 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at RP-5 is 3611.13 feet above mean sea level .

Depth to water measurements collected on September 17 between 6:30 - 7:35 am.

Depth to water in RP-5 was 0.74 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at CGR-8 is 3626.88 feet above mean sea level .

Depth to water measurements collected on Nove mber 12 between 6:23 and 7:26 am.

Depth to water in CGR-8 was 9.98 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at CGR-9 is 3627.55 feet above mean sea level .

Depth to water measurements collected on Nove mber 12 between 6:23 and 7:26 am.

Depth to water in CGR-9 was 9.65 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at CGR-10 is 3625.42 feet above mean sea level .

Depth to water measurements collected on Nove mber 12 between 6:23 and 7:26 am.

Depth to water in CGR-10 was 6.79 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at P-5 is 3639.57 feet above mean sea level .

Depth to water measurements collected on Nove mber 12 between 6:23 and 7:26 am.

Depth to water in P-5 was 13.81 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at P-10 is 3640.66 feet above mean sea level .

Depth to water measurements collected on November 12 between 6:23 and 7:26 am.

Depth to water in P-10 was 20.64 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at P-11 is 3624.24 feet above mean sea level .

Depth to water measurements collected on Nove mber 12 between 6:23 and 7:26 am.

Depth to water in P-11 was 6.08 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at P-15 is 3606.98 feet above mean sea level .

Depth to water measurements collected on November 12 between 6:23 and 7:26 am.

Depth to water in P-15 was 1.35 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at OW-7U is 3624.70 feet above mean sea level .

Depth to water measurements collected on Nove mber 12 between 6:23 and 7:26 am.

Depth to water in OW-7U was 11.77 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at RP-1 is 3616.4 feet above mean sea level .

Depth to water measurements collected on November 12 between 6:23 and 7:26 am.

Depth to water in RP-1 was 1.67 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at RP-2 is 3614.32 feet above mean sea level .

Depth to water measurements collected on November 12 between 6:23 and 7:26 am.

Depth to water in RP-2 was 1.50 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at RP-3 is 3617.27 feet above mean sea level .

Depth to water measurements collected on November 12 between 6:23 and 7:26 am.

Depth to water in RP-3 was 4.21 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at RP-4 is 3617.74 feet above mean sea level .

Depth to water measurements collected on November 12 between 6:23 and 7:26 am.

Depth to water in RP-4 was 2.53 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

11/23/2010 9:38	1.19	456.67	3610.47

Notes:

Transducers used were InSitu Level Troll 700© datalogging pressure transducer.

Top of casing elevation at RP-5 is 3611.13 feet above mean sea level .

Depth to water measurements collected on November 12 between 6:23 and 7:26 am.

Depth to water in RP-5 was 0.74 feet below top of casing.

Depth is measured as feet of water column above the pressure transducer.

ft amsl Feet above mean sea level

Notes:

Flume installed for spring CBS-2 is a Baski, Inc. one-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 225* (h^2)

where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

Notes:

Flume installed for spring CBS-9 is a Baski, Inc. one-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 225* (h^2)

where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

Notes:

Flume installed for spring ES-3 is a Baski, Inc. four-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 932* (h^2)

where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstrean depth readiing in feet

Appendix I1 - ES-3A Flume Readings

October 2010

CG Roxane - Cabin Bar Ranch

Date and Time	Front Depth	Back Depth	ES-3A Flow	ES-3 Flow	Corrected ES-3A Flow Rate (gpm) [1]
10/28/10 16:21	0.200	0.05	76.0	6.0	70.0
10/29/2010 8:46	0.235	0.09	104.9	7.5	97.4
10/29/2010 16:17	0.240	0.05	109.4	7.5	101.9

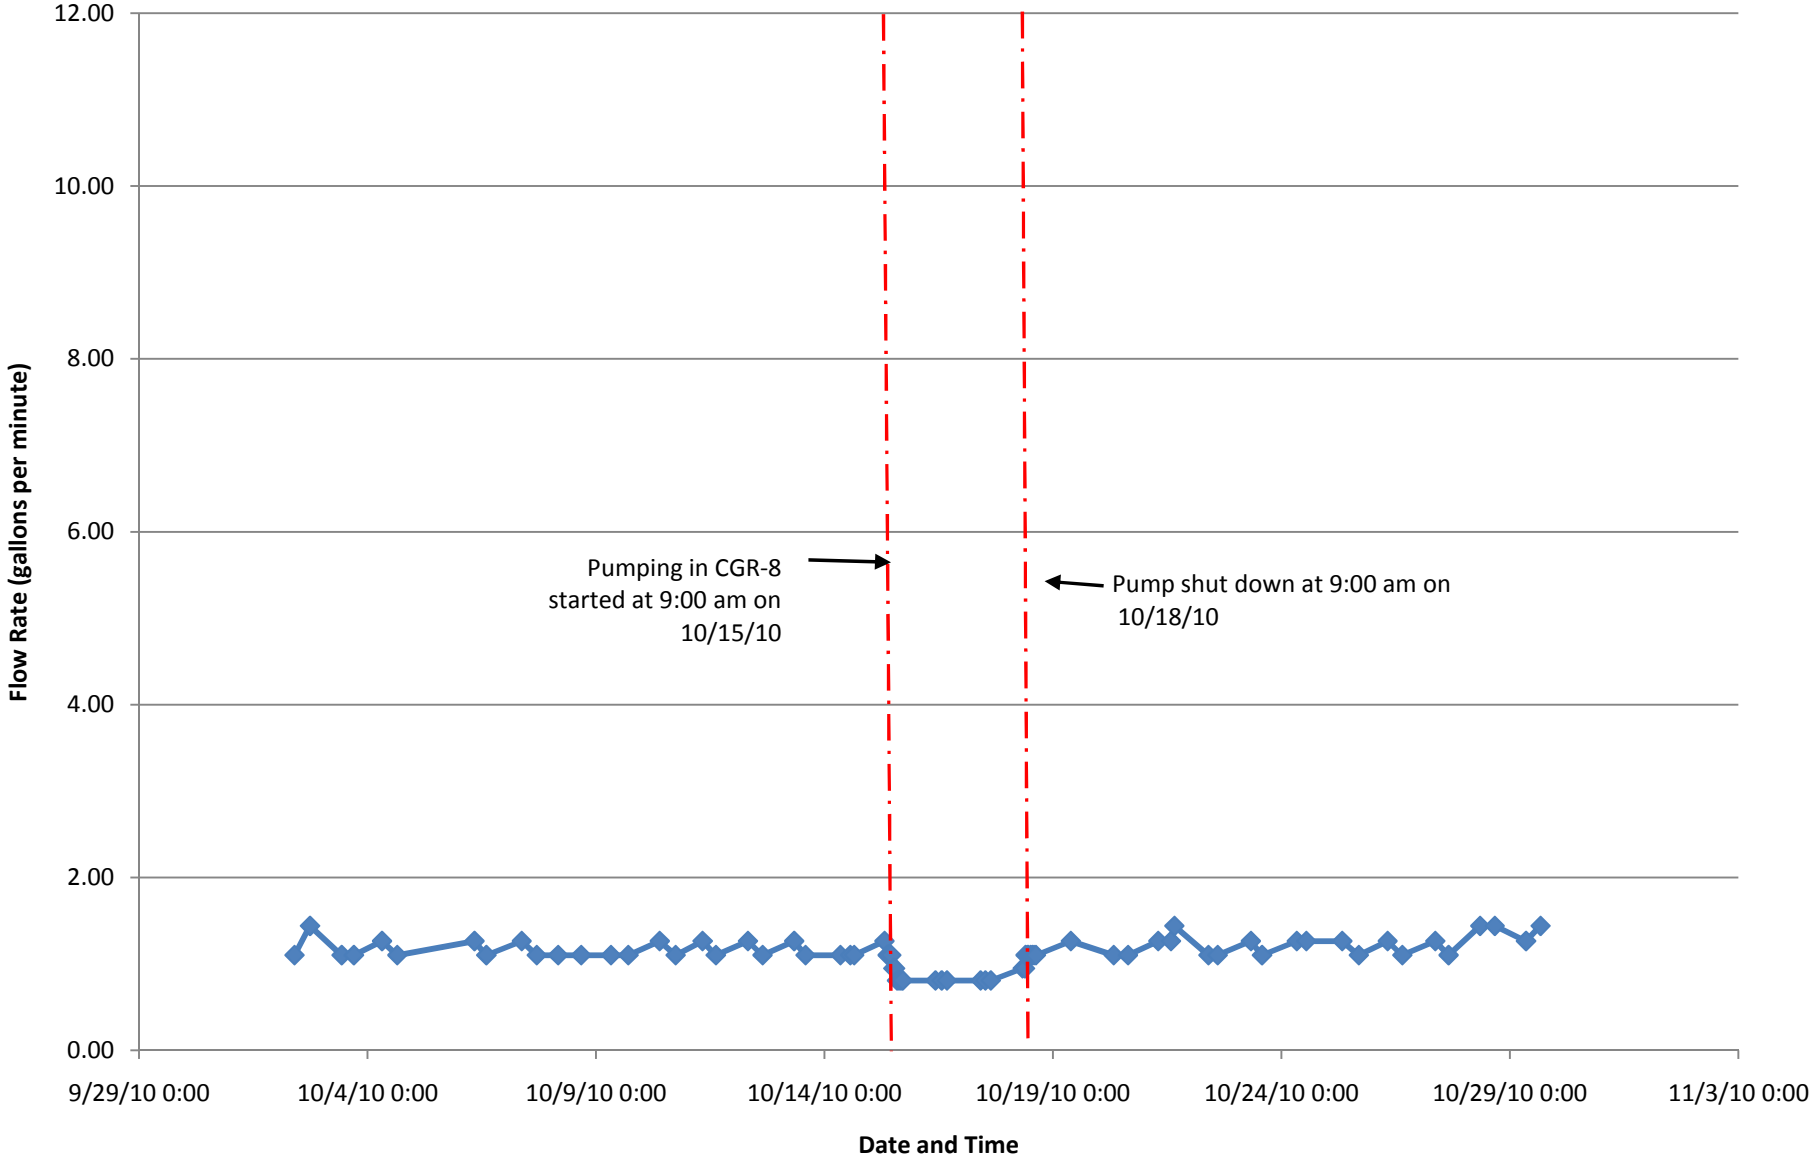
Notes:

Flume installed for spring ES-3A is a Baski, Inc. eight-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 1900* (h^2)

where h is the upstream gauge depth in feet.



1: Flow from ES-3 flows into ES-3A spring, therefore the calculated flow rate for ES-3A is the difference of ES-3 and ES-3A readings.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

Notes:

Flume installed for spring CBS-2 is a Baski, Inc. one-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 225* (h^2)

where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

Notes:

Flume installed for spring CBS-4 is a Baski, Inc. one-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 225* (h^2)

where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

Notes:

Flume installed for spring CBS-6 is a Baski, Inc. one-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 225* (h^2)

where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

Notes:

Flume installed for spring CBS-9 is a Baski, Inc. one-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 225* (h^2)

where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

Notes:

Flume installed for spring ES-3 is a Baski, Inc. four-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 932* (h^2)

where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

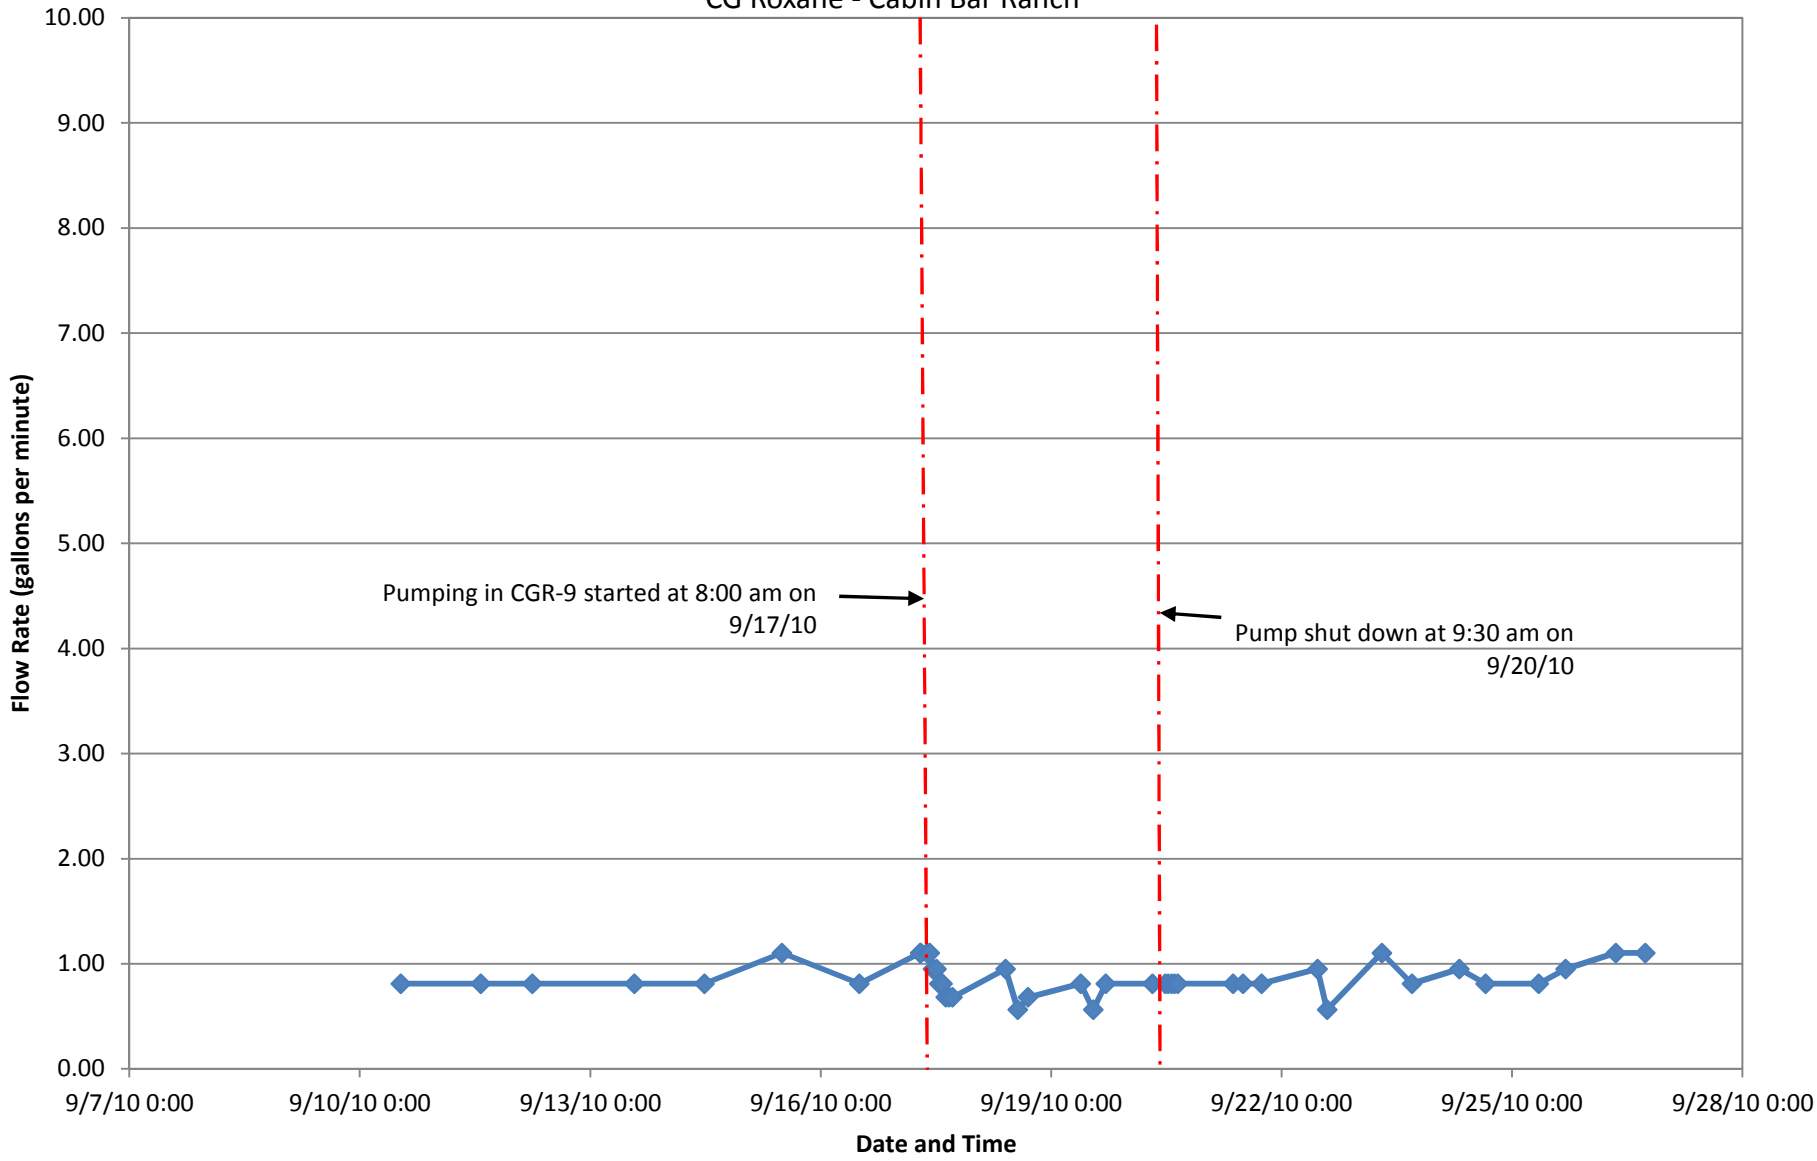
Notes:

Flume installed for spring ES-3A is a Baski, Inc. eight-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 1900* (h^2)



where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

1	Flow from ES-3 flows into ES-3A spring, therefore the calculated flow rate for ES-3A is the difference of ES-3 and ES-3A readings.
gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

11/28/10 16:15	0.200	0.050	9.00

Notes:

Flume installed for spring CBS-9 is a Baski, Inc. one-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 225* (h^2)

where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

Appendix I3 - ES-1 Flume Readings

Notes:

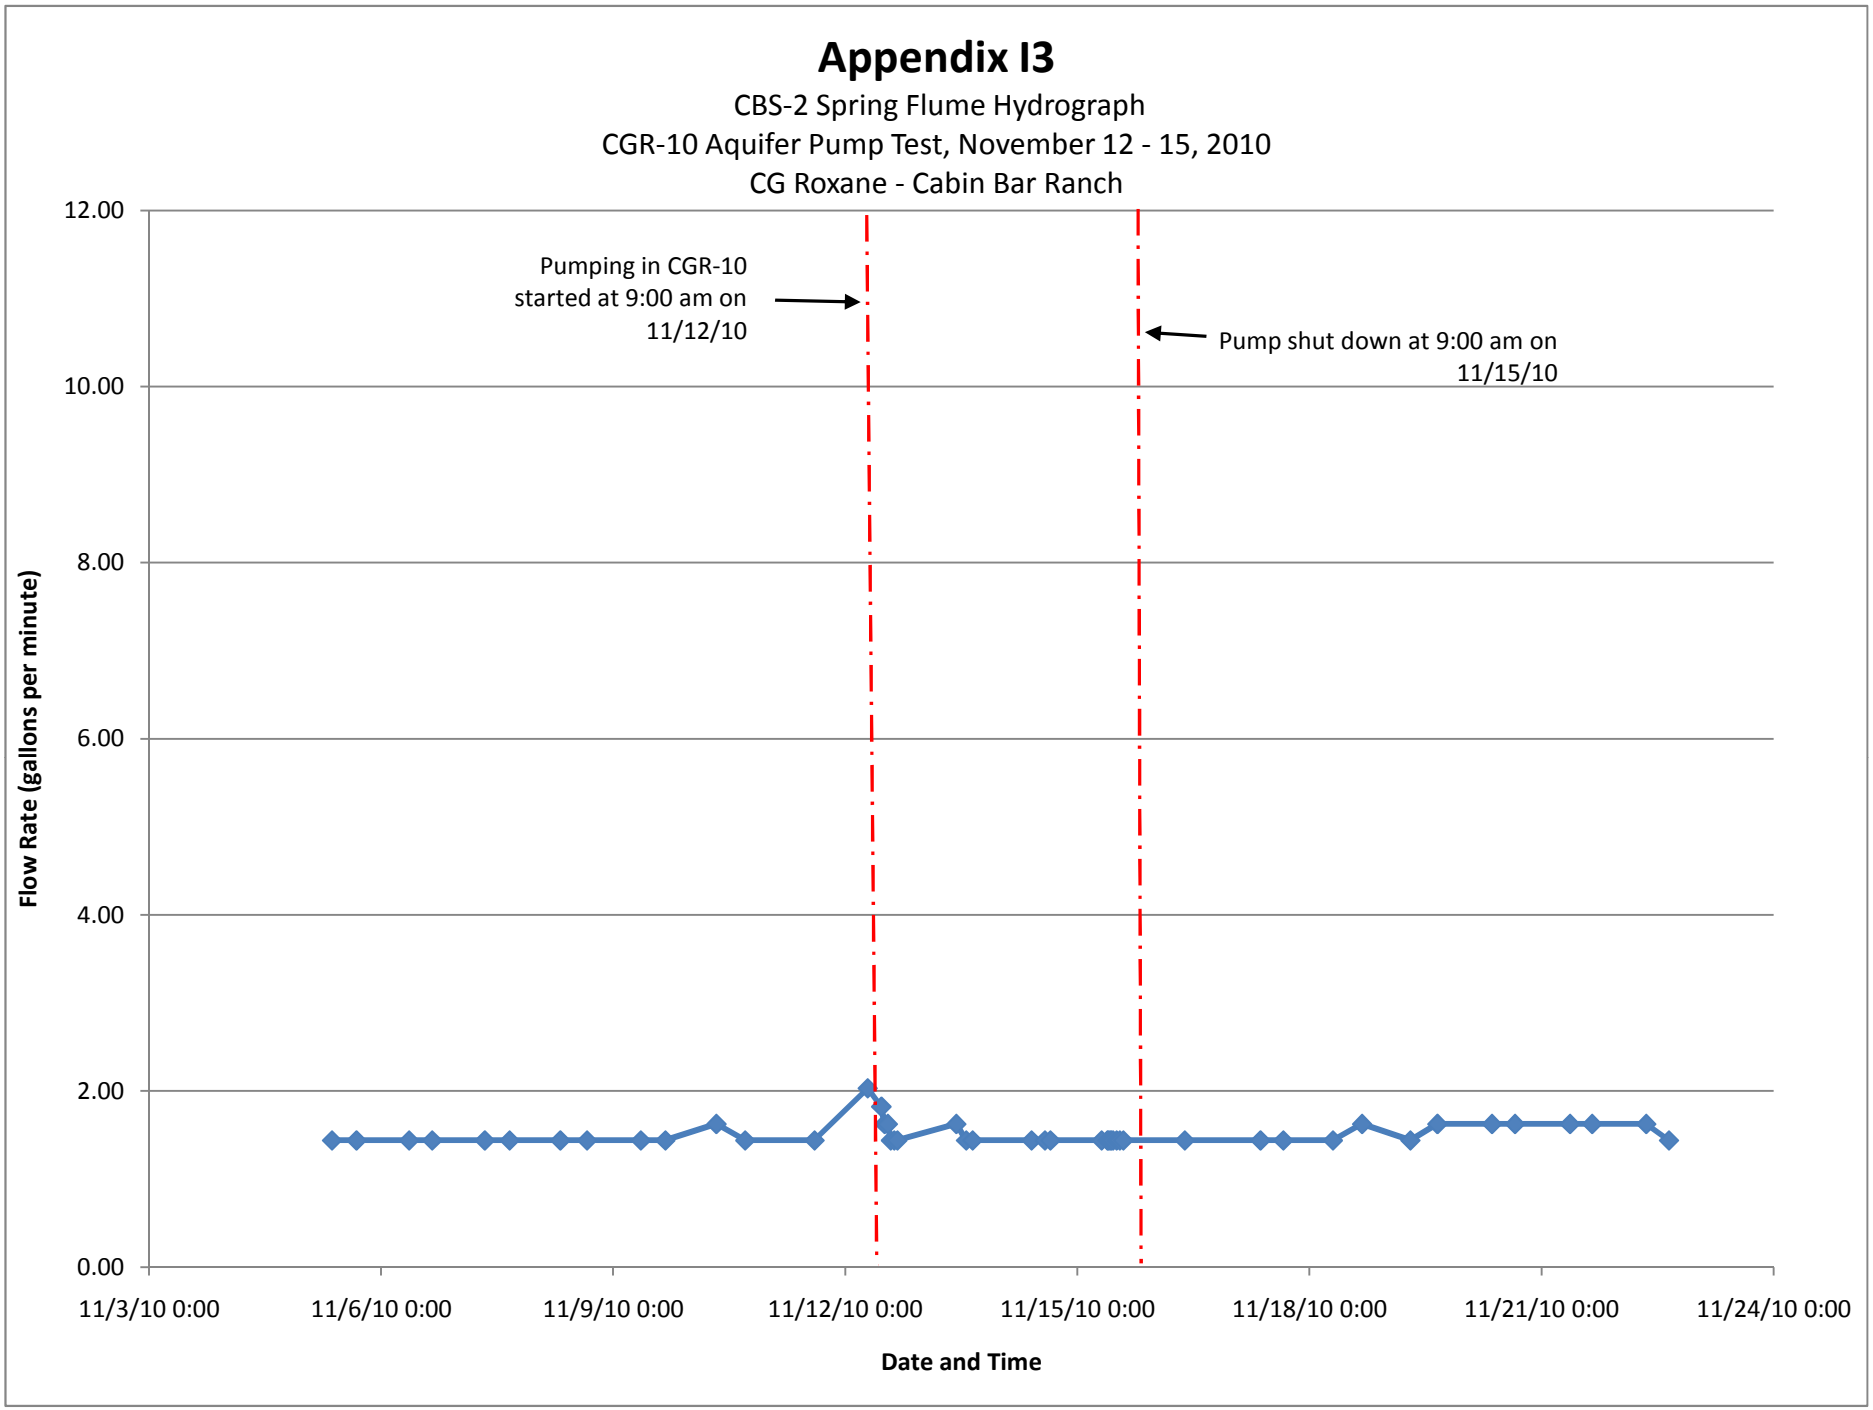
Flume installed for spring ES-3A is a Baski, Inc. eight-inch cutthroat flume.

Flow rate is determined by the equation:

Flow (gpm) = 1900* (h^2)



where h is the upstream gauge depth in feet.

Flows calculated with a front depth less than 0.10 feet are estimated based on flume manufacturers specifications.

1	Flow from ES-3 flows into ES-3A spring, therefore the calculated flow rate for ES-3A is the difference of ES-3 and ES-3A readings.
gpm	gallons per minute
Front Depth	upstream depth reading in feet
Back Depth	downstream depth reading in feet

APPENDIX J

AQUIFER TEST ANALYSIS METHODOLOGY AND AQTESOLV© SOLUTIONS

AQUIFER PUMP TEST ANALYSIS METHODOLOGY

The aquifer test software AQTESOLV for Windows® version 4.0 was used to analyze the drawdown data collected during the aquifer tests. The groundwater elevation data collected from the transducers along with the pumping data collected from the pumping well were used to estimate aquifer properties. AQTESOLV was used to estimate aquifer properties of transmissivity using both a leaky confined aquifer solution, and an unconfined aquifer solution. Hydraulic conductivity was calculated using the equation:

$$T = Kb$$

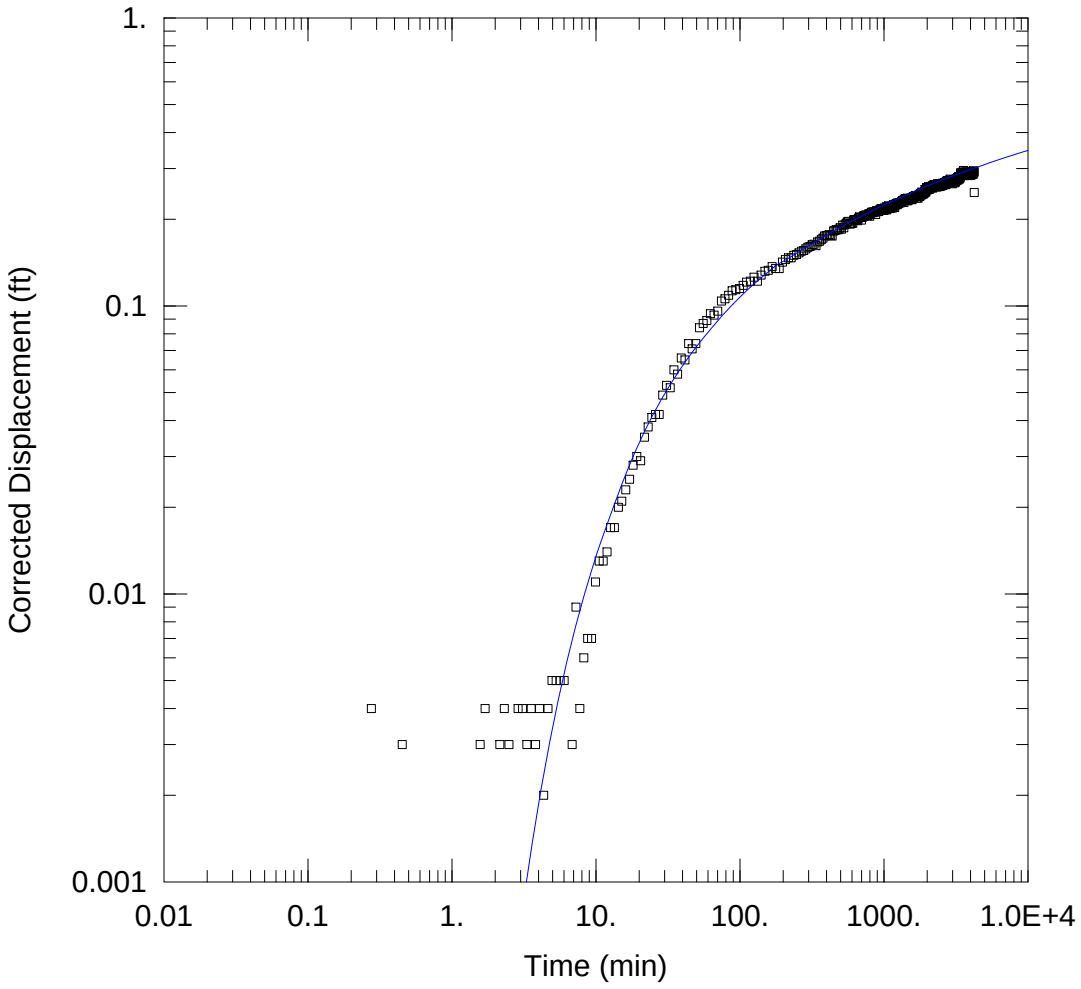
Where T is transmissivity, K is hydraulic conductivity, and b is the aquifer thickness. The aquifer thickness was evaluated using the saturated thickness of the shallow producing zone from the top of water to the top depth of the silty clay layer beneath the Site. The AQTESOLV software allows both manual (visual curve matching) and automatic evaluation (auto curve matching) of the data. Generally, both techniques were used and the best fit was selected for reporting. The Theis (1935) unconfined solution and the Neuman-Witherspoon (1969) leaky confined solution was used for each pump test analysis. The Theis unconfined solution is a type curve solution for a pumping test in an unconfined aquifer with variable rate and partial penetration and applies Jacob's correction for partial dewatering of aquifer applied to drawdown data. The Neuman-Witherspoon leaky-confined solution is type curve solution for a pumping test in a leaky confined two-aquifer system with variable rate and storage in the aquitard. Both solutions selected account for partial penetration of wells in the shallow zone aquifer.

CGR-8 Pump Test

Data collected from wells CGR-9, CGR-10, and piezometer P-4 were used for the aquifer analysis for the CGR-8 aquifer pump test. The unconfined Theis solution, and the leaky confined Newman-Witherspoon solution was used for analysis. In general, the Newman-Witherspoon leaky solution fit the drawdown curves better than the Theis unconfined solution.

CGR-9 Pump Test

Data collected from wells CGR-8, CGR-10, and piezometers P-2 and P-12 were used for the aquifer analysis for this test. The unconfined Theis solution, and the leaky confined Newman-Witherspoon solution was used for analysis. In general, the Newman-Witherspoon leaky solution fit the drawdown curves better than the Theis unconfined solution.



CGR-10 Pump Test

Data collected from wells CGR-8, CGR-9, and piezometers P-5, and P-11 were used for the aquifer analysis for this test. The unconfined Theis solution, and the leaky confined Newman-Witherspoon solution was used for analysis. In general, the Newman-Witherspoon leaky solution fit the drawdown curves better than the Theis unconfined solution.

RE: Project: 219-9110: CGR 8 Source
Pace Project No.: 3520568

Dear Jennifer Fee:

Enclosed are the analytical results for 4 samples received by the laboratory on 10/19/10.
The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

This report is a customer approved, simplified report format as described in the 2003 NELAC standard 5.5.10.1. Additional information that is part of a standard NELAC report but is not included here, is maintained by the laboratory and available upon request.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Bo Garcia

RE: Project: 219-9110
Pace Project No.: 3035762

Dear Terri Deschuiteneer:
Enclosed are the analytical results for sample(s) received by the laboratory on October 19, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Robbin Robl

QUALIFIERS

Project: 219-9110
Pace Project No.: 3035762

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty

(MDC) - Minimum Detectable Concentration

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

RE: Project: 219-9110
Pace Project No.: 3035761

Dear Terri Deschuiteneer:
Enclosed are the analytical results for sample(s) received by the laboratory on October 19, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Robbin Robl

Report Number: G492-3458

Client Project: 219-9110 CGR 8 Source

Enclosed are the results of the analytical services by Method 1613 for 2378-TCDD performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Amy Boehm at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America, Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America, Inc.

When you receive your sampling equipment please remove and freeze ice paks. Follow these instructions to use the MPA sampling equipment:

1. Use latex gloves to protect hands. Turn on the tap to be sampled to purge the line of residual debris for 2 to 3 minutes or until the turbidity of the water is uniform.

2. Assemble sampling apparatus: (a) Connect one end of the black inlet hose (included in kit) to sampling port and the other end of the hose to the sampling apparatus - pressure reducer side. (b) Connect garden hose to blue ball valve end. (c) Screw the filter housing (included in the kit) onto the sampling unit, hand tight.

3. Flush the system: The blue ball valve should be wide open when flushing system. Allow 20 gallons (76 L) to pass thru the filtration apparatus **without the filter**.

4. After flushing the system, turn off the tap and empty the filter housing of all water. Handling it aseptically, place filter cartridge (included in kit) in the filter housing and screw housing back onto equipment. **MARK DOWN THE METER READING BEFORE STARTING SAMPLING.**

5. Turn sample port back on and regulate flow through equipment with the blue ball valve. Let the sample water run until the suggested volume is filtered, or until the filter turns beige in color. Water flow should be ***1 gallon (3.8 L) per minute*** and pressure should be 10-30 PSI.

   MINIMUM VOLUME: 700 gallons minimum (1200 - 1400 gallons is optimal)

6. Once the sample is collected, turn off the water flow and record the meter readings (to determine total volume filtered) and time of sampling .

7. Disconnect the sampling apparatus, making sure the inlet hose level is above the outlet hose level to prevent backwashing and loss of the sample particulates from the filter.

8. Unscrew the filter housing and pour the residual water (last 100-200 mL) in the filter holder into the sterile plastic bottle (included in kit).

9. Aseptically remove the filter, placing it into a ziplock bag. Seal bag and **then double bag**. Complete the enclosed labels using an indelible pen to clearly identify the outer ziplock bag with the information listed below.

   - Sample site and type (Finished Water, Raw Water...)
   - Sample date and time

10. Complete the Chain of Custody with the following information and return it in ziplock bag with the sample:

    - Location, date and time of collection
    - Collector's name
    - Volume filtered
    - Sample type (water, soil, sludge, etc.)
    - Special remarks concerning the sample, if applicable

11. If multiple MPA samples are to be taken, thoroughly drain and rinse the filter housing and hoses several times between samples or flush the system with at least 20 gallons of the water. Sample finished (cleanest) water first and raw (dirtiest) water last.

12. Store sample immediately at 2-5°C until arrival at lab. **Do not freeze the filter or residual water during transport or storage.**

SHIPPING SAMPLES

1. Ship filter and water sample via **Next Day Air** in cooler with FROZEN ice pak to: Montgomery Watson Labs
   750 Royal Oaks Dr., Suite 100
   Monrovia, CA 91016
   (626) 386-1125

2. Return sampling apparatus to: Compliance Designs, Inc.
   159 South Stark Highway
   Weare, NH 03281

Group Comments

(MPA)Using EPA method 910/9-92-029, the methodology's numerical scoring for indication of risk of ground water being under the influence of surface water falls in 3 different categories. Low risk is a numerical score of 9 or less. Moderate risk is a score of 10 - 19. High risk is 20 and above. Certain bio-indicators may be associated with surface water. The bio-indicators observed in the samples are assigned a specific risk factor depending on their importance as a health risk factor and the weight of this determines the risk of surface water contamination.

The Comments Report may be blank if there are no comments for this report.

RE: Project: 219-9111: CGR 9 Source
Pace Project No.: 3518288

Dear Jennifer Fee:

Enclosed are the analytical results for 3 samples received by the laboratory on 09/21/10.
The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

This report is a customer approved, simplified report format as described in the 2003 NELAC standard 5.5.10.1. Additional information that is part of a standard NELAC report but is not included here, is maintained by the laboratory and available upon request.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Bo Garcia

Perchlorate Sampling Instructions-for Sterile sample collection
Revised August 2006

Note these instructions and minimum 100 ml sample volume are required for all Massachusetts samples for perchlorate.

When sampling from a tap, allow it to run for 3-5 minutes to stabilize the temperature.

1. Collect a sample in a plastic 125 ml bottle (provided). Samples must be sterile filtered in the field to prevent microbiological degradation from anaerobic bacteria.
2. Remove the sterile syringe from its package and remove the plunger.
3. Remove the sterile syringe filter from its package without touching the exit Luer connection; then connect the filter to the syringe, making sure that no water from the syringe drops on the exterior of the filter.
4. Pour about 25 ml of sample into the syringe, making sure that no water from the syringe drops on the exterior of the filter.
5. Depress the syringe plunger gently and discard the first 3-5 ml.
6. Open the sterile container provided without touching the inside of the container.
7. Filter at least 25 ml into the sterile container.
8. Repeat step 7 enough times (by pouring additional volume into the syringe) to filter at least 100 ml of sample total.
9. Do not let the syringe or filter come in contact with the sterile container.
10. When you are finished filtering, seal the container tightly, label and prepare the container for shipping.
11. Discard the filter and syringe.

Apply airbill to outside of cooler and ship overnight to:

Montgomery Watson Laboratories
750 Royal Oaks Drive, Suite 100
Monrovia, CA 91016
(626) 386-1125

Be sure to keep samples cool while awaiting pickup.

After printing this label:
1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com.FedEx will not be responsible for any claim in excess of $100 per package, whether the result of loss, damage, delay, non-delivery,misdelivery,or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim.Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic valueof the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental,consequential, or special is limited to the greater of $100 or the authorized declared value. Recovery cannot exceed actual documented loss.Maximum for items of extraordinary value is $500, e.g. jewelry, precious metals, negotiable instruments and other items listed in our ServiceGuide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

QUALIFIERS

Project: 219-9111
Pace Project No.: 3034271

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty

(MDC) - Minimum Detectable Concentration

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

Enclosed are the results of the analytical services by Method 1613 for 2378-TCDD performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Amy Boehm at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America, Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America, Inc.

RE: Project: 219-9318: CGR 10
Pace Project No.: 3522177

Dear Jennifer Fee:

Enclosed are the analytical results for 4 samples received by the laboratory on 11/16/10.
The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

This report is a customer approved, simplified report format as described in the 2003 NELAC standard 5.5.10.1. Additional information that is part of a standard NELAC report but is not included here, is maintained by the laboratory and available upon request.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Bo Garcia

After printing this label:
1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com.FedEx will not be responsible for any claim in excess of $100 per package, whether the result of loss, damage, delay, non-delivery,misdelivery,or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim.Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic valueof the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental,consequential, or special is limited to the greater of $100 or the authorized declared value. Recovery cannot exceed actual documented loss.Maximum for items of extraordinary value is $500, e.g. jewelry, precious metals, negotiable instruments and other items listed in our ServiceGuide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

RE: Project: 219-9318
Pace Project No.: 3037302

Dear Terri Deschuiteneer:
Enclosed are the analytical results for sample(s) received by the laboratory on November 16, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Robbin Robl

QUALIFIERS

Project: 219-9318
Pace Project No.: 3037302

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty

(MDC) - Minimum Detectable Concentration

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

RE: Project: 219-9318
Pace Project No.: 3037303

Dear Terri Deschuiteneer:
Enclosed are the analytical results for sample(s) received by the laboratory on November 16, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Robbin Robl

Report Number: G492-3487

Client Project: 219-9318 CGR 10

Enclosed are the results of the analytical services by Method 1613 for 2378-TCDD performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Amy Boehm at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America, Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America, Inc.

When you receive your sampling equipment please remove and freeze ice paks. Follow these instructions to use the MPA sampling equipment:

1. Use latex gloves to protect hands. Turn on the tap to be sampled to purge the line of residual debris for 2 to 3 minutes or until the turbidity of the water is uniform.

2. Assemble sampling apparatus: (a) Connect one end of the black inlet hose (included in kit) to sampling port and the other end of the hose to the sampling apparatus - pressure reducer side. (b) Connect garden hose to blue ball valve end. (c) Screw the filter housing (included in the kit) onto the sampling unit, hand tight.

3. Flush the system: The blue ball valve should be wide open when flushing system. Allow 20 gallons (76 L) to pass thru the filtration apparatus **without the filter**.

4. After flushing the system, turn off the tap and empty the filter housing of all water. Handling it aseptically, place filter cartridge (included in kit) in the filter housing and screw housing back onto equipment. **MARK DOWN THE METER READING BEFORE STARTING SAMPLING**.

5. Turn sample port back on and regulate flow through equipment with the blue ball valve. Let the sample water run until the suggested volume is filtered, or until the filter turns beige in color. Water flow should be ***1 gallon (3.8 L) per minute*** and pressure should be 10-30 PSI.
   MINIMUM VOLUME: 700 gallons minimum (1200 - 1400 gallons is optimal)

6. Once the sample is collected, turn off the water flow and record the meter readings (to determine total volume filtered) and time of sampling .

7. Disconnect the sampling apparatus, making sure the inlet hose level is above the outlet hose level to prevent backwashing and loss of the sample particulates from the filter.

8. Unscrew the filter housing and pour the residual water (last 100-200 mL) in the filter holder into the sterile plastic bottle (included in kit).

9. Aseptically remove the filter, placing it into a ziplock bag. Seal bag and **then double bag**. Complete the enclosed labels using an indelible pen to clearly identify the outer ziplock bag with the information listed below.

   - Sample site and type (Finished Water, Raw Water...)
   - Sample date and time

10. Complete the Chain of Custody with the following information and return it in ziplock bag with the sample:

    - Location, date and time of collection
    - Collector's name
    - Volume filtered
    - Sample type (water, soil, sludge, etc.)
    - Special remarks concerning the sample, if applicable

11. If multiple MPA samples are to be taken, thoroughly drain and rinse the filter housing and hoses several times between samples or flush the system with at least 20 gallons of the water. Sample finished (cleanest) water first and raw (dirtiest) water last.

12. Store sample immediately at 2-5°C until arrival at lab. **Do not freeze the filter or residual water during transport or storage.**

SHIPPING SAMPLES

1. Ship filter and water sample via **Next Day Air** in cooler with FROZEN ice pak to: Montgomery Watson Labs
   750 Royal Oaks Dr., Suite 100
   Monrovia, CA 91016

After printing this label:
1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com.FedEx will not be responsible for any claim in excess of $100 per package, whether the result of loss, damage, delay, non-delivery,misdelivery,or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim.Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic valueof the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental,consequential, or special is limited to the greater of $100 or the authorized declared value. Recovery cannot exceed actual documented loss.Maximum for items of extraordinary value is $500, e.g. jewelry, precious metals, negotiable instruments and other items listed in our ServiceGuide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Group Comments

(MPA)Using EPA method 910/9-92-029, the methodology's numerical scoring for indication of risk of ground water being under the influence of surface water falls in 3 different categories. Low risk is a numerical score of 9 or less. Moderate risk is a score of 10 - 19. High risk is 20 and above. Certain bio-indicators may be associated with surface water. The bio-indicators observed in the samples are assigned a specific risk factor depending on their importance as a health risk factor and the weight of this determines the risk of surface water contamination.

The Comments Report may be blank if there are no comments for this report.

Crystal Geyser Roxane

QC Ref # 577281 - Microscopic Particulate Analy. **Analysis Date: 11/19/2010**

201011160285 219-9317 CGR-10 Analyzed by: NWM

APPENDIX L

GROUNDWATER MODELING METHODOLOGY

Modeling Objectives

To simulate the salient features of the groundwater flow field, including pumping wells, springs, hydraulic barriers and sources of recharge. The model was developed to explore the following specific reactions to the proposed pumping from wells at the Crystal Geyser-Roxanne facility at the Cabin Bar Ranch in Olancha, CA:

- Assess effects to long-term spring flow on Cabin Bar Ranch.
- Assess effects to groundwater elevations to the north and south of the Cabin Bar Ranch.

Numerical Code, Assumptions, and Limitations

Groundwater flow was simulated using MODFLOW (USGS). The model was developed, operated, and analyzed in the graphical user interface Groundwater Modeling System (GMS) 7.0 from Aquaveo.

The model simulates saturated, steady-state flow with uniform density and temperature, and spatially-varying anisotropic hydraulic properties within three model layers.

The model was calibrated using both trial-and-error, and the automatic inverse modeling code PEST from the USGS, which is automatically coupled to MODFLOW in GMS 7.0

Model development and calibration was conducted for the sole purpose of the current objectives. Primary importance was applied to determining the effects of different pumping scenarios on the springs and boundary well groundwater levels.

Model Design

A variety of information and data were used in developing the model. The lithology of the site area was simulated to represent the shallow aquifer, the fine-grained layer (silt/clay) at a depth of approximately 80 feet below ground surface, and the underlying sandy aquifer as homogenous model layers. All values were based upon typical values for the given materials, except for the distribution of hydraulic conductivity for the upper layer, which was parameterized automatically via inverse modeling to fit groundwater head and spring flow data.

The model domain encompasses the area bordered by the foothills of the Sierra Nevada Mountains to the west, beyond the town of Cartago to the north, the Owens Lakebed to the east, and the existing facility to the south (refer to Figure L.1). The trapezoidal model domain encompasses 11846 feet northing, and 7204 feet easting at the north boundary and 11775 feet easting south boundary; the total domain area equals 112,412,617 square feet (~4.0 square miles). The model coordinates are geo-referenced to the State Plane Coordinate System NAD83 Zone IV for easy integration with well survey data, aerial imagery, and digital elevation models.

The hydrostratigraphy of the site was simulated as a composition of three major groundwater units: an upper sand layer, a middle fine-grained layer, and a deep sand layer. The elevation of the top of the upper layer was interpolated from a Digital Elevation Model generated from a GeoTIFF of the site obtained from the USGS National Map Viewer. The top of the middle layer was calculated as the minimum of either 3550ft MSL or the top of the upper layer minus 75ft. The middle layer was fixed with a thickness of 10ft throughout the domain. The bottom of the deep layer was fixed at 3300ft MSL. The elevation of

the bottom of any layer is equal to the elevations of the top of the underlying layer. The aquitard-like properties of the fine-grained layer (middle layer) were presumed to extend from the eastern domain boundary westward to the western edge of the valley floor/HWY-395 area. The remainder of the middle layer to the west was assigned the same properties as the deep sand layer, simulating a pinching out of the aquitard. All layers were considered anisotropic with vertical and horizontal conductivities based upon layer depth (refer to Figure L.2).

The east and west boundaries were assigned constant head values to impose a regional horizontal gradient throughout the model domain. These, along with the north and south boundaries, are presumed far enough to avoid boundary effects on the area of interest. Constant head boundaries were based on the extrapolation of a surface created from averaged head observations in various wells and piezometers over the time period of October 8th through October 15th, 2010. This time period included representative pumping at the existing production wells at the facility.

Other boundary conditions included production wells, evapotransipiration and drains (to simulate springs). The production wells CGR-2, CGR-7, CGR-3, and CGR-4 were simulated at a combined rate of 300 acre-feet per year with production distributed at 70%, 20%, 5%, and 5%, respectively, to each well based on personal communications with CGR. The model simulated a maximum ET rate of 0.01 feet per day from the surface which equates to 3.65 feet per year. This ET rate is within the range of previously published ET rates for the Owens Valley as presented in the JMM Draft Environmental Impact Report/ Environmental Assessment Report (JMM, 1993). The ET rates published range from 2.6 ft/year (empirical method where groundwater is less than 8 feet bgs) published by Williams in 1969, to 4.4 ft/year (open water or mudflats) published by Danskin in 1988.

Solution Techniques

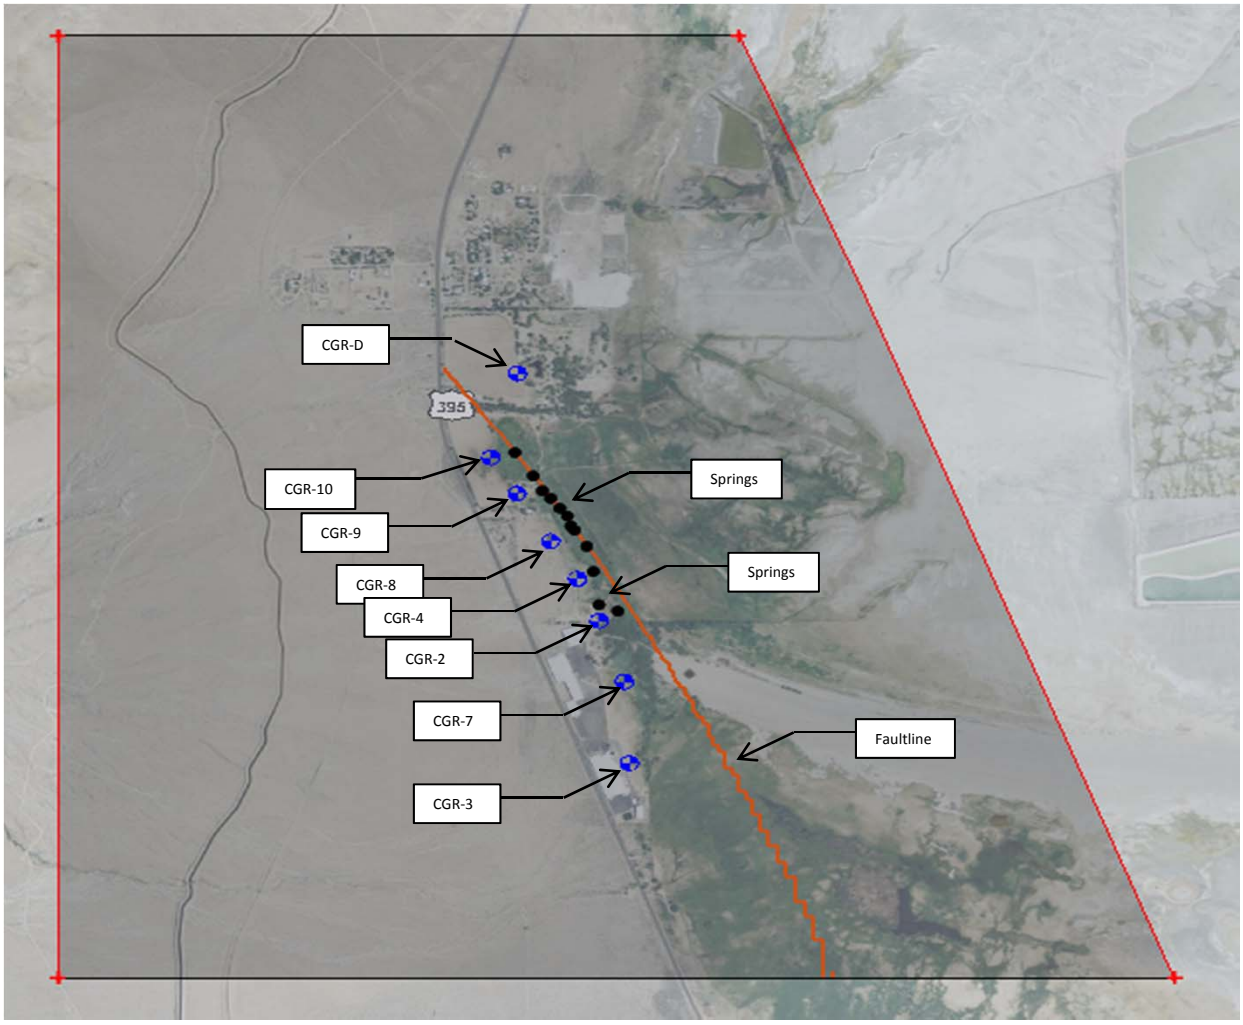
The model was solved using the Preconditioned Conjugate-Gradient (PCG) package with default convergence criteria (0.01ft for head change, and 0.01ft^3/d for the residual), and the cell by cell flow calculations were solved using the Layer Property Flow (LPF) package. Sources and sinks were implemented with the Drain (DRN), Well (WEL), Horizontal Flow Barrier (HFB) and Time Varying Specified Head (CHD) packages.

Model Calibration

The model was run in steady-state mode with iterative modifications made to feature properties as calibration to available data. The iterative process included manual “trial-and-error” parameterization as well as automated parameter estimation using PEST which is coupled to MODFLOW via the GMS 7.0 interface. Data used to calibrate the model included averaged head observations in various wells and piezometers and averaged flows through the monitored springs, as well as an estimated flow in the collector ditch, over the time period of October 8th through October 15th, 2010. These data were taken during regular pumping operations at the southern facility; thus the model was calibrated with averaged annual pumping rates in the existing production wells.

Model Simulations

The calibrated model was used to test springflow changes and groundwater head changes at the Cabin Bar Ranch. In addition to a “base case” with no additional pumping, four scenarios were tested with



incremental increases in pumping rates from the proposed production wells. The scenarios tested included:

- Scenario 1: CGR-8, CGR-9, and CGR-10 pumping at 16.75 gpm, and CGR-D (domestic well) pumping at 5.6 gpm.
- Scenario 2: CGR-8, CGR-9, and CGR-10 pumping at 33.5 gpm, and CGR-D (domestic well) pumping at 11.2 gpm.
- Scenario 1: CGR-8, CGR-9, and CGR-10 pumping at 50.25 gpm, and CGR-D (domestic well) pumping at 16.8 gpm.
- Scenario 1: CGR-8, CGR-9, and CGR-10 pumping at 67.0 gpm, and CGR-D (domestic well) pumping at 22.4 gpm.

Results

The model outputs pertinent to this analysis include the total discharge through all springs (simulated with the DRN package), and the heads in wells P-10 and OW-7U. The table below shows the results from each pumping scenario described in the previous sub-section.

	CGR-8,9,10	CGR-D	Drain Flow	Observation Point	
Scenario	gpm	gpm	gpm	P-10	OW-7U
0 (Base)	0	0	433	3616.59	3615.58
1	16.75	5.6	414	3616.54	3615.48
2	33.5	11.2	395	3616.49	3615.38
3	50.25	16.8	376	3616.45	3615.28
4	67	22.4	358	3616.40	3615.18
